

Voyageurs Wetland Restoration Project Logo and Website

In 2015, Voyageurs National Park staff started the **Voyageurs Wetland Restoration Project** to restore wetlands that had been degraded by invasive hybrid cattails and other factors. The goal of this project is to mechanically remove cattail and other invasive plants and restore native vegetation, such as wild rice, using new and established techniques. Our project is also evaluating the effectiveness of our restoration strategies for their use in Voyageurs National Park and the surrounding region.

Voyageurs National Park staff and partners have been working to restore degraded wetlands during Phases 1 & 2 of the project since our start in 2015. We are currently seeking funds to initiate Phase 3 of the project.
